INTRA AND INTERREGIONAL MIGRATION PATTERNS AND ITS CORRELATES  
IN TURKEY

Dr. Şinasi AYDEMİR

Black Sea Technical University , Trabzon/Turkey

The migration pattern in Turkey has been interest for many researchers and institutions (Shorter.F, 1971., Şanlı.I, 1973., Tekili.I, 1978). The growth of population, development of economy and the changing social structure of the country have effects on the migration patterns.

1980 migratin figures of the State Statistical Department gives some clues for the migration process.

Potential migration receiving areas has shifted from west of the country to mid-west then spread in to the country such as inner Anatolian and Souht-East Anatolian regions.

Fith the growing **diseconomies** in the major cities and the immense investment projects like GAP ( South East Anatolia Irrigation and Power Production Projects) and the forseen likely concequences of these also resulted in changes in settlement patterns in GAP region.

In this paper, it is attempted to investigate the migration ~~pat-~~terns ~~on the intra and~~ interregional bases between 1975-1980. The migrations will be exhibited interms of in/out migratiör pools, and the origins-destinations (province, city, country, village). Also, the ratios of male-female migrants to total migration figures has been shown.

On the other hands, the correlates of migration process will be examined and the findings of this investigation will be compared with the previous studies to portray the changes in time.
